November 1956

EARTAG IDENTIFICATION OF GRADE DHIA ANIMALS

DHIA Rule 3, Identification of Animals, (Revised June 1956) states "Every dairy animal in DHIA herds must be positively identified and recorded on registry page DHIA-16 of the owner's herd-record book within 60 days after entering the herd by birth or purchase. Acceptable identification shall be (1) registration numbers, or (2) old or new series DHIA or ABA eartag numbers, or (3) new uniform disease eradication and control eartag numbers. (State code, 3-letter prefix, 4 digits). Tattoo numbers are acceptable on purebred animals as temporary identification until the animals enter the milking herd."

Compliance with this rule is necessary if the lactation records of grade animals are to be processed satisfactorily and used to prove DHIA sires when all sire-proving work is placed on electronic data processing tape equipment.

It is impractical, however, to retag with new series eartags all the animals in DHIA herds now carrying old disease control eartag numbers. In order, therefore, to effect a practical transition from old to new eartags in DHIA herds, the following procedure is recommended.

1. Old disease control eartag numbers of cows with records previously reported will be accepted since these numbers have been visually checked and are not duplicated in the record system.
2. All two-year-old grade cows (first calf) and all grade cows with records being reported for the first time must be identified with the new DHIA, ABA or disease control eartag (State code, 3-letter prefix, 4 digit).
All cows in new herds coming into the Standard DHIA record plan must also be identified with the new eartags (DHIA, ABA or disease control - State code, 3-letter prefix, 4 digit number).
3. Old DHIA (State code, 2-letter prefix, 4 digit) eartag numbers are satisfactory identification because there is no duplication in this controlled series of numbers.
4. When a cow is retagged an eartag of the new series must be used and both the old (lost eartag) number and the new eartag number must be included in the 718 report.

After March 1, 1957, old disease control eartag numbers will not be accepted as satisfactory identification on 718 reports unless the cow has a previously reported lactation record in the permanent DHIA record system in the Branch. Therefore, DHIA supervisors should be alerted at once to follow the above procedure in reporting lactation records to avoid having their 718 reports with inadequate identification returned to them after March 1, 1957.

DHIA PROVED-SIRE RECORDS TABULATED IN OCTOBER 1956

Following is a list of 359 sires whose records were tabulated or retabulated by the Dairy Husbandry Research Branch in October 1956. Production records used in proving DHIA sires consist of 305-day lactation records standardized to a mature equivalent twice-a-day milking basis.

An asterisk at the end of a sire's registration number indicates a retabulated record. The asterisk may be followed by any number from 1 through 15 (i. e., *12) to indicate in which of the 15 printed lists his previous record appeared. Or the asterisk may be followed by the month and year (i. e., *May 51) of the DHIA letter in which his previous record appeared. Two asterisks following the sire's registration number, or following reference to a previous listing, indicate that the proved-sire tabulation or retabulation was requested by one of the States.

In case records from more than one herd were used, the reference is to the herd from which production records for the largest number of the sire's youngest daughters were reported. If the sire has been used in an artificial-breeding association, the name of the association is given.

Proved-sire records consisting of fewer than 10 comparisons are indicated as "preliminary proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

Proved-sire records consisting of fewer than 25 comparisons with daughters resulting from artificial breeding are indicated as "preliminary AB proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

To make the most intelligent selection of a sire, the dairyman should use these proved-sire records to single out the most promising sire and then make every effort to supplement these data with additional information gathered from the herds in which the dams and daughters made their records. Particular attention should be given to the feeding practices and environmental conditions under which the records were made, in order to be assured that the records of the daughters were not made under more favorable conditions than those of the dams or vice versa. It is especially important to determine that there has been no selection of daughters in making the comparison.
